

Event Schedule Template SOP

Standard operating procedure for the V8.6 clean tested Excel template

Template file	C:\kwi-automations\projects\Schedule of events\Schedule of Events V8.6 - Codex Clean Tested Template.xlsx
Primary owner	Event operations / schedule owner
Version rule	Save a new version before structural edits or bulk imports.
Purpose	Maintain one source of truth for event data and produce readable daily, weekly, location, sponsor, speaker, attendee, and run-of-show views.
Operating rule: Data Input is the source of truth. All schedule views should be treated as outputs from that table, not as places to type event data.	

1. Scope

Use this SOP when creating, updating, testing, printing, or distributing the event schedule workbook. It applies to day-of-event schedules, week-at-a-glance schedules, run-of-show planning, and summary views by location, sponsor, speaker, and required attendee.

2. Workbook Map

Sheet	Primary use	User action
Data Input	Master event table.	Enter and edit event rows here.
Reference	Dropdown/source lists.	Add new categories, locations, owners, statuses, and filters inside the table area.
Daily Schedule	One-day printout.	Select date/filter values; do not type into the schedule grid.
Weekly Calendar	Grid-style weekly view.	Set week start and optional filters.
Weekly Calendar New	Formula-driven weekly event list.	Use as a cleaner print option when the grid is dense.
Run of Show	Minute-by-minute event rundown.	Select location and event; fill in cues, leads, tech, and notes.

Location Schedule	Printable location utilization list.	Review rooms/spaces by event time.
Sponsors / Speakers / Required Attendees	Printable filtered lists.	Review only events where those fields are populated.
Instructions	Built-in workbook guide.	Use for quick reminders and onboarding.

3. Adding or Updating Events

1. Open the latest clean template or working copy.
2. Go to Data Input and add one event per row inside EventInputTable.
3. Complete Show Name, Organizer, KWI POC, Start Date, Start Time, End Date, End Time, Event Name, Location, Category, Class, and Status.
4. For timed events, use real Excel time values in Start Time and End Time.
5. For unknown timing, use TBD. For true all-day items, use All Day.
6. Enter multiple required attendees, speakers, or sponsors as comma-separated names.
7. Recalculate or reopen the workbook if a formula-driven view does not update immediately.

4. Adding Categories and Dropdown Values

8. Open Reference.
9. Add the new plain category name in the Categories column. Do not type the Category: prefix in the source category column.
10. Use the generated Category: value in Data Input.
11. Keep new values inside the ReferenceListsTable shaded/table area so validations and formulas continue to pick them up.

5. Reading the Main Views

View	What to check	Common issue
Daily Schedule	Timed events appear in hourly slots; overlaps shift across slot columns.	If missing, check date/time, filters, location, category, and class.
TBD row	TBD events for the selected day appear once.	If duplicated, verify the bottom table is All-Day Events only.
All-Day Events	All-day items for the selected day appear below the timed grid.	If missing, confirm Start/End Date matches the selected day.
Weekly Calendar	Use for a fast visual of the week.	Dense weeks may be easier to read in Weekly Calendar New.

Run of Show	Minute rows start at selected event start time.	Requires numeric start and end times.
-------------	---	---------------------------------------

6. Testing Before Distribution

Required QA: Always test on a QA copy, not the clean template. The clean template should remain free of test events.

- Add a new reference category and use it on a test event.
- Add three overlapping timed events and verify schedule slots calculate as 1, 2, and 3.
- Add a TBD event and verify it appears once in the TBD row.
- Add an all-day event and verify it appears once in All-Day Events.
- Confirm Weekly Calendar New, Location Schedule, Sponsors, Speakers, and Required Attendees update from Data Input.
- Select a test event on Run of Show and confirm the minute timeline starts at the correct time.
- Save, close, reopen, and re-check the same items.

7. Printing and Distribution

- Use Daily Schedule for the day-of handout.
- Use Weekly Calendar or Weekly Calendar New for weekly planning.
- Use Location Schedule for room/space coordination.
- Use Run of Show for event leads, stage managers, speakers, and AV coordination.
- Before printing, check that filters are set correctly and the selected date/week is correct.

8. Version Control

12. Never overwrite the last known-good file.
13. Use a new version number for structural changes, formula updates, or workflow changes.
14. Keep a clean template and a separate QA working copy.
15. After QA passes, distribute only the clean tested template.

9. Troubleshooting Quick Reference

Symptom	Likely cause	First check
Event missing from Daily Schedule	Date/time/filter mismatch.	Data Input Start Date, Start Time, End Time, Show, Location, Category, Class.
Overlap appears in wrong column	Schedule slot formula or time overlap edge case.	Rows with same show/date and overlapping numeric times.
TBD appears in timed grid	Time value entered inconsistently.	Use exact TBD in Start/End Time fields.
All-day event missing	Start/End Date not matching selected day.	D/F date fields and All Day text in E/G.
Summary tab missing new row	Workbook not recalculated or event field blank.	Save/reopen and confirm sponsor/speaker/attendee field is populated.
